

Sage 200 Evolution Version Recommendation for Converge

Oct 27, 2026 · @Olufemi Rafiu Mohammed

To: Nkiru, Converge

From: Layer21

Subject: Sage 200 Evolution version required to connect to the Layer21 e-invoicing platform

Purpose

This note confirms which version of Sage 200 Evolution Converge needs so that invoices raised in Sage can be sent through Layer21 to the FIRS e-invoicing platform (MBS) for IRN validation. It also lists what Layer21 needs from Converge to plan the connection.

Recommendation

Layer21 recommends that Converge runs **Sage 200 Evolution version 11.x or 12.x**. The lowest version Layer21 can connect to is **version 9.0**.

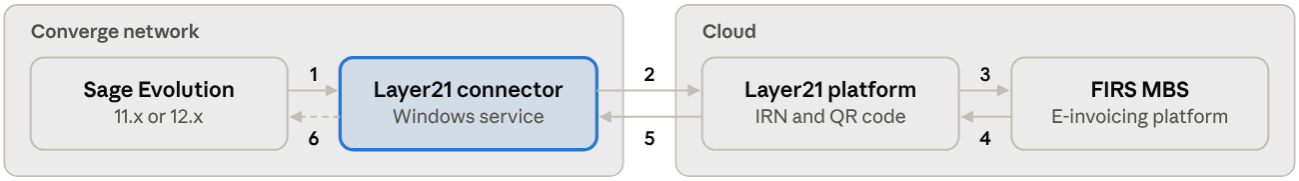

- **Version 11.x or 12.x (recommended):** full support. Layer21 sends invoices to FIRS and can write the IRN and QR code back into Sage so they print on Converge's invoices.
- **Version 9.x or 10.x (supported, not preferred):** the connection works. Each of these releases needs its own version of Sage's developer toolkit (SDK), so testing takes longer. Converge should plan to upgrade.
- **Below version 9.0:** not supported. Converge would need to upgrade before go-live.

If Converge is already on 11.x or 12.x, no upgrade is needed. Converge should still apply the latest service pack for its version before testing starts.

How the connection works

Sage 200 Evolution runs on Converge's own server and cannot send invoices out by itself. Layer21 installs a small connector service on Converge's network. It picks up each posted invoice and sends it to Layer21 for FIRS validation.

Invoices flow out from the Converge server, with no inbound access needed

1 Connector reads newly posted invoices from Sage
2 Connector sends each invoice to Layer21 over HTTPS
3 Layer21 validates the invoice and submits it to FIRS
4 FIRS confirms the IRN
5 Layer21 returns the IRN and QR code
6 Written into Sage (optional, needs SDK licence)

Sage 200 Evolution to FIRS through Layer21 · 6 steps

All traffic starts from Converge's server, so no inbound firewall ports need to be opened. Step 6 is optional and needs the Sage licence described below.

Support by version

Sage 200 Evolution version	Layer21 support	Send invoices to FIRS	Write IRN and QR code back into Sage	Action for Converge
12.x	Recommended	Yes	Yes	None
11.x	Recommended	Yes	Yes	None
10.x	Supported	Yes	Yes, after version-specific testing	Plan an upgrade to 11.x or 12.x
9.x	Minimum supported	Yes	Yes, after version-specific testing	Plan an upgrade to 11.x or 12.x
8.x and older	Not supported	No	No	Upgrade before go-live

Version 9.0 is the floor because Sage's current integration tools and the connectors built on them do not support older releases. Sage's SDK must match the Sage version's first two numbers. One SDK build covers all of 11.x, which is why 11.x and 12.x are the simplest to support.

What Converge needs in place

Requirement	Needed for	Details
Sage 200 Evolution 11.x or 12.x, latest service pack	Everything	Minimum 9.0 (see above)
Windows server on Converge's network	Everything	Hosts the Layer21 connector. Usually the server that runs Sage's SQL Server database. Must stay on during business hours.
.NET Framework 4.8	Everything	Installed on the connector server
Outbound internet access on HTTPS (port 443)	Everything	From the connector server to the Layer21 platform. No inbound ports need to be opened.
Read-only SQL Server login	Sending invoices to FIRS	`db_datareader` on the Sage company database
Sage **SDK Client Connector** licence	Writing the IRN and QR code back into Sage	Bought from Sage or a Sage business partner, renewed yearly. Shows under **Help > About** in Sage once registered.
SQL Server login with write access	Writing the IRN and QR code back into Sage	`db_owner` on the SageCommon database, and `db_datareader` plus `db_datawriter` on the company database
Active Layer21 business account	Everything	Includes Converge's FIRS service ID and Layer21 API credentials

The SDK Client Connector licence is optional. Without it, invoices still go to FIRS and the IRN and QR code are available in the Layer21 portal, but they do not appear on invoices printed from Sage.

What we need from Converge

To confirm the version, open Sage 200 Evolution and go to **Help > About**. The full version number is shown there (for example, 11.1.6.0), along with the licensed modules.

Please send Layer21:

1. The full Sage 200 Evolution version number from **Help > About**
2. A screenshot of the licensed modules list on the same screen, so we can see whether the SDK Connector is licensed
3. The SQL Server version, and the Windows version of the server that hosts the Sage database
4. How many Sage company databases need to send invoices to FIRS
5. Which documents need to go to FIRS (for example, tax invoices and credit notes) and the approximate number per month
6. Whether Converge wants the IRN and QR code printed on invoices from Sage
7. Contact details for Converge's Sage business partner, if Converge has one

Next steps

1. Converge sends the details listed above.
2. Layer21 confirms in writing that Converge's version is compatible, or what upgrade is needed.
3. If needed, Converge upgrades Sage and arranges the SDK Client Connector licence through its Sage business partner.
4. Layer21 installs the connector on Converge's server and tests it against a copy or test company before connecting live data.
5. Converge signs off the test results, and the connection goes live.

Please reply to Layer21 with the details above or any questions about this recommendation.
